## ~~Package numdisplay~~

---

numdisplay: Package for displaying numpy arrays in IRAF-compatible image display tool such as DS9 or XIMTOOL.

Displaying a numpy array object involves:

1. Opening the connection to a usable display tool (such as DS9).
2. Setting the display parameters for the array, such as min and max array value to be used for min and max grey scale level, along with any offset, scale factor and/or transformation function to be applied to the array.
3. Applying any transformation to the input array. This transformation could be a simple numpy ufunc or a user-defined function that returns a modified array.
4. Building the byte-scaled version of the transformed array and sending it to the display tool. The image sent to the display device will be trimmed to fit the image buffer defined by the 'imtdev' device from the 'imtoolrc' or the 'stdimage' variable under IRAF. If the image is smaller than the buffer, it will be centered in the display device.

All pixel positions reported back will be relative to the full image size.

This package provides several methods for controlling the display of the numpy array; namely,

`open(imtdev=None):`

Open the default display device or the device specified in 'imtdev', such as 'inet:5137' or 'fifo:/dev/imt10'.

`close():`

Close the display device defined by 'imtdev'. This must be done before resetting the display buffer to a new size.

`display(pix, name=None, bufname=None, z1=None, z2=None, transform=None, scale=None, offset=None, frame=None):`  
Display the scaled array in display tool (ds9/ximtool/...).  
name -- optional name to pass along for identifying array

bufname -- name of buffer to use for displaying array  
to best match size of array (such as 'imt1024')  
[default: 512x512 buffer named 'imt512']

z1,z2 -- minimum/maximum pixel value to display (float)  
Not specifying values will default  
to the full range values of the input array.

transform -- Python function to apply to array (function)

`zscale` -- use an algorithm like that in the IRAF display task.  
If `zscale=True`, any `z1` and `z2` set in the call to `display` are ignored. Using `zscale=True` invalidates any transform specified in the call.

`contrast` -- same as the `contrast` parameter in the IRAF display task. Only applies if `zscale=True`. Default value = 0.25. Higher contrast values make `z1` and `z2` closer together, while lower values give a gentler (wider) range.

`scale` -- multiplicative scale factor to apply to array (float/int)  
Persistent, so to reset it you must specify `scale=1` in the `display` call.

`offset` -- additive factor to apply to array before scaling (float/int)  
This value is persistent, so to reset it you have to set it to 0.

`frame` -- image buffer frame number in which to display array  
(integer)

The display parameters set here will ONLY apply to the display of the current array.

`readcursor(sample=0)`:  
Return a single cursor position from the image display.  
By default, this operation will wait for a keystroke before returning the cursor position. If 'sample' is set to 1, then it will NOT wait to read the cursor.  
This will return a string containing: x,y,frame and key.

`help()`:  
print Version ID and this message.

Example:

The user starts with a 1024x1024 array in the variable 'fdata'. This array has min pixel value of -157.04 and a max pixel value of 111292.02. The display tool DS9 has already been started from the host level and awaits the array for display. Displaying the array requires:

```
>>> import numdisplay
>>> numdisplay.display(fdata)
```

If there is a problem connecting to the DS9 application, the connection can be manually started using:

```
>>> numdisplay.open()
```

To bring out the fainter features, an offset value of 158 can be added to the array to allow a 'log' scaling can be applied to the array values using:

```
>>> numdisplay.display(fdata,transform=numpy.log,offset=158.0)
```

To redisplay the image with default full-range scaling:

---

To redisplay using the IRAF display zscale algorithm, and with a contrast value steeper than the default value of 0.25:

```
>>> numdisplay.display(fdata, zscale=True, contrast=0.5)
```

## 1.1 Modules

- **displaydev**: displaydev.py: Interact with IRAF-compatible image display Modeled after the NOAO Client Display Library (CDL)  
Public functions:  
readCursor(sample=0) Read image cursor position  
open(imtdev=None) Open a connection to the display server.  
(Section 2, p. 6)
- **imconfig**: Version 1.0alpha - 9-Oct-2003 (WJH)  
loadImtoolrc (imtoolrc=None): Locates, then reads in IMTOOLRC configuration file from system or user-specified location, and returns the dictionary for reference.  
(Section 3, p. 12)
- **setup** (Section 4, p. 13)
- **zscale** (Section 5, p. 14)

## 1.2 Functions

<b>help()</b>
<hr/> Print out doc string with syntax and example.

## 1.3 Class NumDisplay

```
__builtin__.object ─┬─
                    │
                    └─ NumDisplay
```

Class to manage the attributes and methods necessary for displaying the array in the image display tool.

This class contains the methods:

```
open(imtdev=None):
```

```
close():
```

```
set(z1=None, z2=None, scale=None, factor=None, frame=None):
```

```
reset(names=None)
```

```
display(pix, name=None, bufname=None):
```

```
readcursor():
```

<b>__init__(self)</b> Overrides: <code>__builtin__object.__init__</code>
<b>close(self)</b> Close the display device entry.
<b>display(self, pix, name=None, bufname=None, z1=None, z2=None, transform=None, zscale=False, contrast=0.25, scale=None, offset=None, frame=None)</b> Displays byte-scaled (UInt8) n to XIMTOOL device. This method uses the IIS protocol for displaying the data to the image display device, which requires the data to be byte-scaled. If input is not byte-scaled, it will perform scaling using set values/defaults.
<b>open(self, imtdev=None)</b> Open a display device.
<b>readcursor(self, sample=0)</b> Return the cursor position from the image display.
<b>reset(self, names=None)</b> Reset specific attributes, or all by default. <b>Parameters</b> <b>names:</b> names of attributes to be reset, separated by commas or spaces; the default is to reset all attributes to None ( <i>type=string or list of strings</i> )
<b>set(self, frame=None, z1=None, z2=None, contrast=None, transform=None, scale=None, offset=None)</b> Allows user to set multiple parameters at one time.

**Inherited from object:** `__delattr__`, `__getattr__`, `__hash__`, `__new__`, `__reduce__`, `__reduce_ex__`, `__repr__`, `__setattr__`, `__str__`

## Module numdisplay.displaydev

---

displaydev.py: Interact with IRAF-compatible image display

Modeled after the NOAO Client Display Library (CDL)

Public functions:

readCursor(sample=0)  
    Read image cursor position

open(imtdev=None)  
    Open a connection to the display server. This is called automatically by readCursor if the display has not already been opened, so it is not generally necessary for users to call it.

    See the open doc string for info on the imtdev argument, which allows various forms of socket and network connections.

close()  
    Close the active display server. Called automatically on exit.

Various classes are defined for the different connections (ImageDisplay, ImageDisplayProxy, UnixImageDisplay, InetImageDisplay, FifoImageDisplay). They should generally be created using the \_open factory function. This could be used to maintain references to multiple display servers.

Ultimately more functionality may be added to make this a complete replacement for CDL.

\$Id: displaydev.py 1064 2007-12-28 18:50:11Z hodge \$

### 2.1 Functions

help()
--------

### 2.2 Class FifoImageDisplay

FIFO version of image display

Module `numdisplay.displaydev` Class `ImageDisplayProxy`

**readInfo**(*self*)  
Read tx and ty from active frame of display device.

**readWCS**(*self*, *wcsinfo*)  
Reads WCS information from active frame of display device.

**selectFB**(*self*, *nx*, *ny*, *reset=None*)  
Select the frame buffer that best matches the input image size.

**setCursor**(*self*, *x*, *y*, *wcs*)  
Moves cursor to specified position in frame.

**setFBconfig**(*self*, *fbnum*, *bufname=None*)  
Set the frame buffer values for the given frame buffer name.

**setFrame**(*self*, *frame\_num=1*)  
Sets the active frame in frame buffer to specified value.

**syncWCS**(*self*, *wcsinfo*)  
Update WCS to match frame buffer being used.

**writeData**(*self*, *x*, *y*, *pix*)  
Writes out image data to x,y position in active frame.

**writeImage**(*self*, *pix*, *wcsinfo*)  
Write out image to display device in 32Kb sections.

**writeWCS**(*self*, *wcsinfo*)  
Writes out WCS information for frame to display device.

**Inherited from object:** `__delattr__`, `__getattr__`, `__hash__`, `__new__`, `__reduce__`, `__reduce_ex__`, `__repr__`, `__setattr__`, `__str__`

## 2.4 Class `ImageDisplayProxy`

Interface to IRAF-compatible image display

Module `numdisplay.displaydev` is a proxy to the actual display that allows retries on failures and can switch between display connections. Class `ImageWCS`

### 2.4.1 Methods

<b><code>__init__(self, imtdev=None)</code></b> Overrides: <code>numdisplay.displaydev.ImageDisplay.__init__</code>
<b><code>close(self)</code></b> Close active image display connection Overrides: <code>numdisplay.displaydev.ImageDisplay.close</code>
<b><code>open(self, imtdev=None)</code></b> Open image display connection, closing any active connection
<b><code>readCursor(self, sample=0)</code></b> Read image cursor value for the active image display Return immediately if <code>sample</code> is true, or wait for keystroke if <code>sample</code> is false (default). Returns a string with <code>x</code> , <code>y</code> , <code>frame</code> , and <code>key</code> . Opens image display if necessary. Overrides: <code>numdisplay.displaydev.ImageDisplay.readCursor</code>
<b><code>setCursor(self, x, y, wcs)</code></b> Moves cursor to specified position in frame. Overrides: <code>numdisplay.displaydev.ImageDisplay.setCursor</code> <code>exitit</code> (inherited documentation)

**Inherited from object:** `__delattr__`, `__getattr__`, `__hash__`, `__new__`, `__reduce__`, `__reduce_ex__`, `__repr__`, `__setattr__`, `__str__`

**Inherited from ImageDisplay:** `eraseFrame`, `getConfigno`, `readData`, `readInfo`, `readWCS`, `selectFB`, `setFBconfig`, `setFrame`, `syncWCS`, `writeData`, `writeImage`, `writeWCS`

## 2.5 Class ImageWCS

### 2.5.1 Methods

<b><code>__init__(self, pix, name=None, title=None, z1=None, z2=None)</code></b> Overrides: <code>__builtin__.object.__init__</code>
<b><code>__str__(self)</code></b> Overrides: <code>__builtin__.object.__str__</code>
<b><code>update(self, wcsstr)</code></b>

**Inherited from object:** `__delattr__`, `__getattr__`, `__hash__`, `__new__`, `__reduce__`, `__reduce_ex__`, `__repr__`, `__setattr__`

## 2.6 Class InetImageDisplay

INET socket version of image display

### 2.6.1 Methods

<b><code>__init__(self, port, hostname=None)</code></b> Overrides: <code>numdisplay.displaydev.UnixImageDisplay.__init__</code>
--

**Inherited from object:** `__delattr__`, `__getattr__`, `__hash__`, `__new__`, `__reduce__`, `__reduce_ex__`, `__repr__`, `__setattr__`, `__str__`

**Inherited from ImageDisplay:** `eraseFrame`, `getConfigno`, `readCursor`, `readData`, `readInfo`, `readWCS`, `selectFB`, `setCursor`, `setFBconfig`, `setFrame`, `syncWCS`, `writeData`, `writeImage`, `writeWCS`

**Inherited from UnixImageDisplay:** `close`

## 2.7 Class UnixImageDisplay

**Known Subclasses:** `InetImageDisplay`

Unix socket version of image display

### 2.7.1 Methods

<b><code>__init__(self, filename, family=1, type=1)</code></b> Overrides: <code>numdisplay.displaydev.ImageDisplay.__init__</code>
---

<b><code>close(self)</code></b> Close image display connection Overrides: <code>numdisplay.displaydev.ImageDisplay.close</code>
---

**Inherited from object:** `__delattr__`, `__getattr__`, `__hash__`, `__new__`, `__reduce__`, `__reduce_ex__`, `__repr__`, `__setattr__`, `__str__`

Module: `ImageDisplay`: `eraseFrame`, `getConfigno`, `readCursor`, `readData`, `readImage`, `readWCS`,  
Inherited from `ImageDisplay`: `selectFB`, `setCursor`, `setFBconfig`, `setFrame`, `syncWCS`, `writeData`, `writeImage`, `writeWCS`

## Module `numdisplay.imconfig`

---

Version 1.0alpha - 9-Oct-2003 (WJH)

`loadImtoolrc (imtoolrc=None):`

Locates, then reads in IMTOOLRC configuration file from system or user-specified location, and returns the dictionary for reference.

The table gets loaded into a dictionary of the form:

```
{configno:{'nframes':n,'width':nx,'height':ny},...}
```

It can then be accessed using the syntax:

```
fbtab[configno][attribute]
```

For example:

```
fbtab = loadImtoolrc()
print fbtab[34]['width']
1056 1024
```

### 3.1 Functions

<code>help()</code>
---------------------

<code>loadImtoolrc(imtoolrc=None)</code>
--

Locates, then reads in IMTOOLRC configuration file from system or user-specified location, and returns the dictionary for reference.
--

### 4.1 Class `smart_install_data`

#### 4.1.1 Methods

<p><b>run(<i>self</i>)</b></p> <p>A command's raison d'être: carry out the action it exists to perform, controlled by the options initialized in 'initialize_options()', customized by other commands, the setup script, the command-line, and config files, and finalized in 'finalize_options()'. All terminal output and filesystem interaction should be done by 'run()'.</p> <p>This method must be implemented by all command classes.</p> <p>Overrides: <code>distutils.command.install_data.install_data.run</code> <code>exitit</code>(inherited documentation)</p>
--

**Inherited from Command:** `__init__`, `__getattr__`, `announce`, `copy_file`, `copy_tree`, `debug_print`, `dump_options`, `ensure_dirname`, `ensure_filename`, `ensure_finalized`, `ensure_string`, `ensure_string_list`, `execute`, `get_command_name`, `get_finalized_command`, `get_sub_commands`, `make_archive`, `make_file`, `mkpath`, `move_file`, `reinitialize_command`, `run_command`, `set_undefined_options`, `spawn`, `warn`

**Inherited from install\_data:** `finalize_options`, `get_inputs`, `get_outputs`, `initialize_options`

#### 4.1.2 Class Variables

Name	Description
<b>Inherited from Command:</b> <code>sub_commands</code> ( <i>p. ??</i> )	
<b>Inherited from install_data:</b> <code>boolean_options</code> ( <i>p. ??</i> ), <code>description</code> ( <i>p. ??</i> ), <code>user_options</code> ( <i>p. ??</i> )	

## Module `mnndisplay.zscale`

---

### 5.1 Functions

```
zsc_compute_sigma(flat, badpix, npix)
```

```
zsc_fit_line(samples, npix, krej, ngrow, maxiter)
```

```
zsc_sample(image, maxpix, bpmask=None, zmask=None)
```

```
zscale(image, nsamples=1000, contrast=0.25, bpmask=None, zmask=None)
```

Implement IRAF zscale algorithm `nsamples=1000` and `contrast=0.25` are the IRAF display task defaults  
`bpmask` and `zmask` not implemented yet `image` is a 2-d numpy array returns (`z1`, `z2`)
